# Project brief checklist

A simple starting point for an Android app, web product, AI feature or internal tool.

---

### 01 THE GOAL

What are you trying to build or improve? What should be easier or possible when the project is finished?

### 02 THE USERS

Who will use it? What do they need to do, and when does the problem happen?

### 03 THE ESSENTIAL FLOW

Describe the main journey in 3-6 steps. What information goes in, what should happen, and what comes out?

### 04 MUST-HAVE FEATURES

List only the features required for the first useful release. Put optional or later ideas in a separate list.

### 05 PLATFORMS & INTEGRATIONS

Android, web, desktop or another platform? Note existing APIs, accounts, databases, files or third-party tools it must connect to.

### 06 DATA & PERMISSIONS

What data is involved? Who can view or change it? Are there privacy, security, approval or retention requirements?

### 07 CURRENT MATERIAL

Share any existing code, screenshots, designs, documents, sample data or reference products that are relevant.

### 08 ACCEPTANCE CHECKS

How will you decide the result works? Name the main user journeys and any important edge cases that must be tested.

### 09 CONSTRAINTS

Mention known dependencies, deadline drivers, technical restrictions or launch requirements. A target date is optional.

### 10 BUDGET & NEXT STEP

A budget range is optional but helps shape scope. What would you like reviewed, estimated or built first?

**You do not need every answer before reaching out. A clear description of the goal and the main user problem is enough to start a scoping conversation.**
